1 Training

In [33]:

```
def nb_train(X, y, alpha=1, K=None, C=None):
    """Train a Naive Bayes model.

    We assume that all features are encoded as integers and have the same domain
    (set of possible values) from 0:(K-1). Similarly, class labels have domain
    0:(C-1).

    Parameters
    ----------
    X : ndarray of shape (N,D)
        Design matrix.
    y : ndarray of shape (N,)
        Class labels.
    alpha : int
        Parameter for symmetric Dirichlet prior (Laplace smoothing) for all
        fitted distributions.
    K : int
        Each feature takes values in [0,K-1]. None means auto-detect.
    C : int
        Each class label takes values in [0,C-1]. None means auto-detect.

    Returns
    -------
    A dictionary with the following keys and values:

    logpriors : ndarray of shape (C,)
        Log prior probabilities of each class such that logpriors[c] contains
        the log prior probability of class c.

    logcls : ndarray of shape(C,D,K)
        A class-by-feature-by-value array of class-conditional log-likelihoods
        such that logcls[c,j,v] contains the conditional log-likelihood of value
        v in feature j given class c.
